It is commonly used for global middleware.

## Q 7. What is routing in Express.js?

**ANS:** Routing defines how an app responds to client requests.
It uses HTTP methods like GET and POST.
It maps URLs to functions.

## Q 8. Difference between GET and POST?

**ANS:** GET fetches data from the server.
POST sends data to the server.
POST is more secure than GET.

## Q 9. What is req in Express.js?

**ANS:** req stands for request object.
It contains client request data.
It includes params, body, and headers.

## Q 10. What is res in Express.js?

**ANS:** **res** stands for response object.
It sends data back to the client.
Methods include **res.send()** and **res.json().**

## Q 11. What is res.send()?

**ANS:** It sends a response to the client.
It can send text, JSON, or HTML.
It automatically sets headers.

## Q 12. What is res.json()?

**ANS:** It sends a JSON response.
Used mainly for APIs.
It converts objects to JSON automatically.

## Q 13. What is next() in Express.js?

**ANS:** It passes control to the next middleware.
Used inside middleware functions.
Prevents request from hanging.

## Q 14. What is body-parser?

**ANS:** It parses incoming request bodies.
Used to read JSON and form data.
Now built into Express.

## Q 15. What is express.json()?

**ANS:** It parses JSON request bodies.
It replaces body-parser for JSON.
Used as middleware.

## Q 16. What is express.urlencoded()?

**ANS:** It parses URL-encoded form data.
Used for form submissions.
Works as middleware.

## Q 17. What is app.listen()?

**ANS:** It starts the Express server.
It listens on a specific port.
Required to run the app.

## Q 18. What is error-handling middleware?

**ANS:** It handles application errors.
It has four parameters.
Defined at the end of middleware.

## Q 19. What is REST API?

**ANS:** REST is an API architecture.
It uses HTTP methods.
Express is commonly used to build REST APIs.

## Q 20. What is CORS?

**ANS:** CORS allows cross-origin requests.
Browsers restrict cross-domain access.
Express uses CORS middleware.

## Q 21. What is router in Express.js?

**ANS:** Router is used to group routes.
It improves code structure.
Defined using express.Router().

## Q 22. What is req.params?

**ANS:** It contains route parameters.
Used for dynamic routes.
Example: /user/:id.

## Q 23. What is req.query?

**ANS:** It contains query string data.
Used for filters and search.
Example: /search?name=abc.

## Q 24. What is req.body?

**ANS:** It contains request body data.
Used in POST and PUT requests.
Requires body parsing middleware.

## Q 25. What is Morgan?

**ANS:** Morgan is a logging middleware.
It logs HTTP requests.
Used for debugging.

## Q 26. What is Nodemon?

**ANS:** Nodemon restarts the server automatically.
Used during development.
It improves productivity.

## Q 27. What is MVC in Express.js?

**ANS:** MVC stands for Model View Controller.
It separates logic and UI.
Express supports MVC structure.

## Q 28. What is JWT?

**ANS:** JWT is used for authentication.
It stores user data securely.
Commonly used with Express APIs.

## Q 29. How to handle 404 errors?

**ANS:** Using middleware at the end.
Send custom error message.
Example: res.status(404).

## Q 30. What is res.status()?

**ANS:** It sets HTTP status code.
Used before sending response.
Example: res.status(200).

## Q 31. What is Helmet?

**ANS:** Helmet improves app security.
It sets HTTP headers.
Used as middleware.

## Q 32. What is Express-session?

**ANS:** It manages user sessions.
Stores session data server-side.
Used for authentication.
